Voice Amplification

Perhaps you have started to notice some differences in how loud you speak. It can be very exhausting trying to raise your voice so you can be heard by others. There are devices that can help you amplify your voice so the machine is doing the volume raising for you. Some perceived benefits from this communication method may be energy conservation and enhancing speech intelligibility. Ideally, there are features that persons living with ALS may want to consider: weight of the amplifier, cost, volume settings, portability, microphone placement, batteries or charger, and simplicity. Some examples of voice amplifiers are listed below. Please contact your local Speech Language Pathologist (SLP) to discuss these options.
